

Console-Based General Knowledge Quiz Game

Interactive Multi-Question Quiz Application built in Python

Intern	Nimra	Organization	Decode Labs
Program	Python Development Internship	Language	Python 3.12.4
Document Type	Project Documentation Report	Status	Completed

1. Project Title & Overview

The Console-Based Quiz Game is an interactive Python program that presents the user with a short series of general knowledge questions directly in the terminal, checks each answer for correctness, and keeps a running score. The program covers three question categories — geography, astronomy, and basic arithmetic — and concludes by displaying the user's final score out of the total number of questions. The application demonstrates straightforward sequential program flow, string normalization for answer checking, and score accumulation.

2. Objectives & Features

Objectives

- Build a simple, self-contained CLI quiz that tests general knowledge across multiple topics.
- Demonstrate accurate answer validation using case-insensitive, whitespace-trimmed string comparison.
- Track and accumulate the user's score across multiple questions using a counter variable.
- Present a clear final result summarizing performance at the end of the quiz.

Key Features

- Three distinct general knowledge questions covering geography, astronomy, and arithmetic.
- Case-insensitive and whitespace-trimmed answer checking via `.lower().strip()`.
- Immediate feedback after each question ("**Correct!**" or the correct answer if wrong).
- Running score counter (**score**) incremented for every correct response.
- Final summary output showing the score as a fraction (e.g. **Your final score is: 2/3**).
- Simple, linear, easy-to-follow program structure ideal for beginners and quick extension.

3. System Requirements & Technologies Used

Item	Details
Language	Python 3.12.4
Standard Modules Used	None required — uses only Python built-ins (<code>input()</code> , <code>print()</code> , string methods)

External Dependencies	None (uses only the Python Standard Library / built-ins)
Operating System	Windows / macOS / Linux (cross-platform)
Execution Environment	Any terminal / command prompt with Python 3 installed
Entry File	main.py

4. Code Architecture & Workflow

The program begins by initializing a **score** variable to **0**, which will track the number of correct answers throughout the quiz.

Each question follows an identical, repeatable pattern: the question is presented via **input()**, the returned string is normalized using **.lower().strip()** (or just **.strip()** for the numeric question) to remove case sensitivity and stray whitespace, and the normalized answer is compared against the expected value inside an **if / else** block. A correct match prints **"Correct!"** and increments **score** by 1; an incorrect match prints the correct answer so the user learns from their mistake. This pattern repeats sequentially for all three questions — capital of France (**"paris"**), the Red Planet (**"mars"**), and the arithmetic question **5 + 7 ("12")**.

Once all three questions have been asked, the program prints a final summary using an f-string: **Game Over! Your final score is: {score}/3**, giving the user immediate, clear feedback on their overall performance.

5. How to Run the Program (CLI)

- 1 Ensure Python 3.12.4 (or a compatible Python 3 release) is installed by running **python --version** (or **python3 --version**) in your terminal.
- 2 Clone or download the repository: **git clone https://github.com/Nimra2304/QUIZProject4_Nimra.git**
- 3 Navigate into the project directory: **cd QUIZProject4_Nimra**
- 4 Run the script: **python main.py** (use **python3 main.py** on macOS/Linux).
- 5 Answer Question 1 (**capital of France**) when prompted, then press Enter.
- 6 Answer Question 2 (**the Red Planet**) when prompted, then press Enter.
- 7 Answer Question 3 (**5 + 7**) when prompted, then press Enter.
- 8 Review your final score, printed as **Game Over! Your final score is: <score>/3**.

6. Screenshots

```
score = 0

answer1 = input("Question 1: What is the capital of France? ")
if answer1.lower().strip() == "paris":
    print("Correct!")
    score += 1
else:
    print("Incorrect! The correct answer is Paris.")

answer2 = input("Question 2: What planet is known as the Red Planet? ")
if answer2.lower().strip() == "mars":
    print("Correct!")
    score += 1
else:
    print("Incorrect! The correct answer is Mars.")

answer3 = input("Question 3: What is 5 + 7? ")
if answer3.strip() == "12":
    print("Correct!")
    score += 1
else:
    print("Incorrect! The correct answer is 12.")

print(f"\nGame Over! Your final score is: {score}/3")
```

Figure 1 — main.py source code (editor view).

```
Question 1: What is the capital of France? paris
Correct!
Question 2: What planet is known as the Red Planet? mars
Correct!
Question 3: What is 5 + 7? 12
Correct!

Game Over! Your final score is: 3/3
```

Figure 2 — Sample terminal execution: all three questions answered correctly, final score 3/3.
